In phonetics, prosody is the use of pitch, loudness, tempo, and rhythm in speech to convey information about the structure and meaning of an utterance. Proposed systems of prosodic hierarchy constraints typically include a third type of constraint whose task is to enforce strict layering. Definitional details aside, “strict layering” describes a situation where full parsing is achieved at every level, so all of the PARSE-INTO-X constraints are fulfilled, as is NO-RECURSION.

Types of Prosody. There are four distinguishable prosodic metrical patterns, which are: Syllabic Prosody – Syllabic prosody counts a fixed number of syllables in each line, while accent, tone, and quantity play a secondary role.
